

FounderConsole.ai

Comprehensive Product Feedback Report — V2

Post-Fix Re-Test + Deep Feature Exploration

March 19, 2026

Tester	Vishesh Khurana (Co-founder, Shiprocket)
Account	vishesh.khurana@shiprocket.com
Company	Shiprocket Logistics/Supply Chain Growth Stage
Testing Period	March 18-19, 2026 (2 sessions)
Version	V2 — Includes re-test after announced bug fixes

5.0

OVERALL

out of 10

Downgraded from 6.5/10 (V1) due to most critical bugs remaining unfixed after announced deployment, plus new regressions.

Category	V1 Score	V2 Score	Change
AI Copilot	8/10	7.5/10	-0.5
Onboarding + Data Input	7/10	6/10	-1.0
Simulation Engine	4/10	1/10	-3.0
Cap Table	5/10	2/10	-3.0
KPI Dashboard	3/10	3/10	0
Board Deck Generator	7/10	7/10	0
Health Check + Briefing	8/10	7/10	-1.0

Investor Room	7/10	7/10	0

7. Data Integrity Issues
8. UX and Product Observations
9. Feature-by-Feature Scoring
10. Prioritized Recommendations
11. Conclusion

1. Executive Summary

FounderConsole.ai was tested extensively across two sessions (March 18-19, 2026) using Shiprocket — a real pre-IPO logistics company with \$222M ARR, \$35M cash, and 1,300 employees — as the test case. After the initial session revealed 5 critical bugs, the FounderConsole team announced bug fixes had been deployed. This V2 report documents the re-test results.

Key Finding: Most Critical Bugs Remain Unfixed

Of the 5 critical bugs reported in V1, only 1 was partially fixed (KPI Dashboard creation). The Simulation Engine, Advanced Data Input, and Cap Table remain completely broken. A new regression was introduced: Cap Table Add Stakeholder now returns HTTP 400 errors, making the feature worse than before the fix attempt.

Despite the critical bugs, certain features performed well. The AI Copilot (Ask AI) consistently delivered thoughtful strategic advice across 10 complex IPO-readiness questions. The Board Deck Generator produced 3 complete decks (Monthly Update, Fundraising Prep, Scenario Analysis). The Health Check and Strategic Briefing features generated comprehensive reports with actionable playbooks.

2. Bug Re-Test Results (Post-Fix)

The following table summarizes re-test results for all bugs reported in the V1 feedback. Testing was conducted on March 19, 2026 at approximately 1:10 PM UTC.

Bug ID	Feature	V1 Error	V2 Status	V2 Error
BUG-001	Simulation Engine	"X is not defined"	STILL BROKEN	Same error. All 6 scenarios crash.
BUG-002	Advanced Data Input	"u.map is not a function"	STILL BROKEN	Same error on Advanced toggle.
BUG-003	Cap Table Persistence	Stakeholders vanish	STILL BROKEN	All 14 stakeholders lost again.
BUG-004	KPI Dashboard	Infinite spinner	PARTIAL FIX	Creates OK, but "v.map" crash on load.
BUG-005	Churn Simulation	"X is not defined"	STILL BROKEN	Same crash as BUG-001.
BUG-006	Cap Table Add Stakeholder	N/A (worked in V1)	NEW BUG	HTTP 400 error on every add attempt.
BUG-007	KPI Dashboard Load	N/A (creation failed)	NEW BUG	"v.map is not a function" on page load.

Fix Rate	0 of 5 fully fixed 1 partially fixed 2 new regressions introduced
Root Cause	"map is not a function" errors suggest Array.map() called on undefined/null values — likely missing data type validation on API responses
Impact	3 of 4 core product pillars (Simulate, Cap Table, Dashboards) are non-functional for real-world use

3. Detailed Bug Analysis

BUG-001: Simulation Engine Crash

Severity: Critical | **Status:** Unfixed | **URL:** founderconsole.ai/simulate

The Simulation Engine is the central value proposition of FounderConsole — it allows founders to model strategic scenarios with Monte Carlo simulations. The entire feature is non-functional due to a JavaScript runtime error: "X is not defined". This error fires immediately when clicking any simulation trigger: custom queries, preset scenarios (all 6 tested), the Adjust Variables Manually button, and the What-If tab.

Business Impact: A founder evaluating FounderConsole specifically to model IPO scenarios, fundraising decisions, or burn rate adjustments cannot use the product at all for its primary purpose. This single bug makes the platform unsuitable for its core use case.

BUG-002: Advanced Data Input Crash

Severity: High | **Status:** Unfixed | **URL:** founderconsole.ai/data

Clicking the "Advanced" toggle on the Data Input page crashes the entire page with "u.map is not a function". This blocks entry of critical metrics: Gross Margin, Churn Rate, and other advanced fields. The Simple mode works fine for basic financials (revenue, cash, expenses) but many important metrics are only accessible in Advanced mode.

Consequence: The AI Copilot and Health Check show a 35% gross margin (system default) instead of the actual 45%. Churn defaults to 3.2% instead of the correct 5%. This means all AI-generated analysis is based on incorrect data — undermining trust in the platform's strategic advice.

BUG-003/006: Cap Table Data Loss + Add Failure

Severity: Critical | **Status:** Unfixed + New Regression | **URL:** founderconsole.ai/cap-table

In Session 1, we added 14 stakeholders (4 founders + 10 investors) and created an IPO round (\$280M at \$1.3B pre-money). By Session 2, all stakeholders had vanished — the Cap Table showed 'No Equity Issued Yet'. The IPO scenario was partially preserved in the Scenarios tab, but stakeholder data was completely lost.

Attempting to re-add stakeholders revealed a new bug (BUG-006): every Add Stakeholder request returns HTTP 400. This makes the Cap Table completely unusable — data cannot be stored or re-entered. For a pre-IPO company, this is a dealbreaker. The Cap Table is essential for equity planning, dilution modeling, and investor reporting.

BUG-004/007: KPI Dashboard Partial Fix

Severity: Medium | **Status:** Partially Fixed | **URL:** founderconsole.ai/dashboards

The dashboard creation flow now works — the infinite spinner bug is resolved. However, immediately after creation, navigating to the dashboard triggers "v.map is not a function". The dashboard exists in the system (visible in the dashboard list) but cannot be viewed or edited. No widgets could be added or tested.

4. AI Copilot Deep Dive

The AI Copilot (Ask AI) was tested with 10 complex, IPO-specific strategic questions using Shiprocket's actual financial data. This is the strongest feature on the platform, consistently providing thoughtful, contextualized answers. Below is a summary of each question and the AI's performance.

Q1: IPO Readiness Assessment

7/10

Detailed assessment of \$1.3B IPO at \$280M raise

Flagged gross margin discrepancy (35% vs 45%), validated runway, suggested COGS reconciliation. Good financial rigor but used incorrect gross margin (Advanced mode bug).

Q2: Burn Cut vs Growth

5/10

30% burn reduction impact with 24% YoY growth

Ran 500 Monte Carlo iterations but returned 0 months runway and 0% survival — clearly incorrect for a \$35M cash / \$2M burn company. Model used wrong parameters.

Q3: Delhivery Competitive Positioning

3/10

How to position against \$2.2B revenue competitor at IPO

Misinterpreted question as a simulation comparison request. Returned "Which scenarios would you like to compare?" instead of strategic positioning advice.

Q4: Pre-IPO Round vs Direct IPO

8/10

\$50M SWF round vs straight to IPO with 17mo runway

Excellent analysis: \$50M extends runway to 42 months, weighed dilution impact, noted market timing considerations. Clear and actionable.

Q5: Data Moat for Public Markets

9/10

What data moat to highlight from 500K daily transactions

Outstanding response. Coined "Shiprocket Logistics Graph" concept, identified network effects + proprietary intelligence as dual moats. Specific and narratively powerful.

Q6: M&A; Strategy Narrative

7/10

Framing 5 acquisitions (Pickrr, Omuni, etc.) for IPO

Solid advice on framing acquisitions as ecosystem building. Suggested consolidation and cost synergies. Could have been more specific to each acquisition.

Q7: AI JV Valuation

5/10

Valuing Ultrasafe AI logistics LLM partnership

Generic advice about margin improvement. Missed opportunity to suggest specific valuation frameworks (DCF of efficiency gains, comp analysis to other AI partnerships).

Q8: Cross-Border TAM Sizing

2/10

\$23B to \$200B India e-commerce export opportunity

Returned "No specific findings from analysis" despite being given concrete market data. Complete failure on this question.

Q9: Capital Allocation

6/10

Optimal split of INR 1,100 Cr fresh issue proceeds

Referenced correct allocation but truncated response. Recommended sustainability focus. Missing: specific allocation percentages, benchmarking against peer IPOs.

Q10: Founder OFS Narrative

8/10

Managing narrative around INR 369 Cr founder selling

Strong advice: frame as confidence in maturity, emphasize profitability path, link to operational efficiency. Addressed investor psychology well.

AI Copilot Overall Assessment: 6.0/10

Strengths: Uses multi-agent architecture (CFO Agent, Market Agent). Enriches with web research. Generates actionable strategic options. Best-in-class for data moat and narrative framing questions.

Weaknesses: Sometimes misinterprets question intent (Q3). TAM sizing failed entirely (Q8). Monte Carlo parameters appear miscalibrated (Q2 returned 0% survival for a profitable company). Truncated responses on complex allocation questions.

Data Gap: Repeatedly suggests connecting Stripe, Shopify, QuickBooks — good prompt but shows over-reliance on integrations. Should still deliver strong answers from manually entered data.

Consistency Issue: Uses 35% gross margin (system default) instead of 45% (user-provided) because Advanced Data Input is broken. All Copilot answers are subtly wrong as a result.

5. Board Deck Generator

Three board deck types were generated and reviewed. The generator uses a dual-AI approach (Claude + GPT-4o) to produce narrative and visual slides.

Deck Type	Slides	Score	Assessment
Monthly Update	6	7/10	Good executive summary, useful metrics layout. Revenue trend charts show \$0 baseline (only 1 month of data). Risks section well-structured.
Fundraising Prep	7	6/10	Traction metrics clear. Forward projections show P10/P50/P90 all at 120 months (unrealistic uniform). 'Use of Funds' slide empty — critical gap for fundraising deck.
Scenario Analysis	6	7/10	Best of the three. Scenario comparison table is genuinely useful — shows churn sensitivity (120mo to 18mo runway). Clear risk/reward framework.

Board Deck Issues

- All three decks use identical executive summary text (Claude-generated) — should be tailored to each deck purpose.
- ARR shows \$60M instead of \$222M — appears to miscalculate from monthly data (MRR x 3.24 instead of x 12).
- Net Burn shows 'N/A' and Runway shows '0.0 mo' despite \$35M cash and \$2M burn being entered.
- Headcount shows 250 instead of 1,300 (the corrected value saved in the data section).
- Multiple slides reference 0% growth rate — no option to enter historical growth data for trending.
- Fundraising Prep deck has empty 'Use of Funds' slide — this should pre-populate from entered IPO allocation data.

6. Health Check and Strategic Briefing

Health Check (Score: 7/10)

The Health Check provides a comprehensive business overview with 20+ computed metrics, unit economics, burn breakdown, cash flow forecast, and risk identification. Key observations:

- **Quality of Growth Index: 75/100** — Reasonable for Shiprocket's stage. The scoring methodology is clear.
- **Gross Margin Conflict:** Shows 82.4% in detailed view but 35% in risk assessment. The system computes its own margin from revenue vs COGS entries, conflicting with user-stated 45%. Three different values for one metric.
- **Headcount Discrepancy:** Reports 250 employees despite 1,300 being saved in data input. Unit economics (Revenue per Employee: \$74K/month) are therefore wrong.
- **Customer Count:** Shows 150 customers — appears to be an AI estimate, not entered data. Should be flagged as estimated.
- **Cash Flow Forecast:** Projects \$247.7M by month 12 — appears unrealistic without growth assumptions.
- **Actionable Suggestions:** 'Model Growth Investment Scenario' and 'Model Strategic Scenario' are solid prompts, but clicking them leads to the broken simulation engine.

Strategic Briefing (Score: 7/10)

The Strategic Briefing is one of the most impressive features. It generates a multi-section report with executive summary, risk assessment (4 risks ranked by severity), a detailed 8-week execution playbook, alternative paths analysis, and a 'What Happens If You Do Nothing' section. Highlights:

- **Execution Playbook:** Three phases (Preparation, Execution, Optimization) over 8 weeks with specific owners, timelines, and 'done when' criteria. Genuinely boardroom-quality.
- **Risk Assessment:** Four risks identified (Revenue Stall, Key Person, Revenue Concentration, Fundraising Environment) with specific trigger points and pivot conditions.
- **Alternative Paths:** Three scenarios (Aggressive Fundraise, Cut to Profitability, Pivot) with clear 'why not now' and 'revisit if' conditions.
- **Issue — Burn Rate:** States '\$18.5M/month burn' which equals the revenue — this is wrong. Net burn is \$2M/month. The system appears to confuse gross expenses with net burn.
- **Issue — Stage Classification:** Labels Shiprocket as 'Early Revenue' stage with 100/100 stability score. A \$222M ARR company is not early revenue.

7. Data Integrity Issues

A critical theme across all features is inconsistent data propagation. Data entered in one section does not reliably appear in others, and the platform generates conflicting values for the same metric.

Metric	Entered Value	System Shows	Where
Gross Margin	45% (blocked)	35%, 82.4%	Copilot, Health Check
Churn Rate	5% (blocked)	3.2%	Health Check
ARR	\$222M	\$60M, \$222M	Board Deck vs Dashboard
Headcount	1,300	250	Health Check, Briefing
Monthly Burn	\$2.05M net	\$0, \$7.05M, \$18.5M	Various features
Runway	17.1 months	0, 17.1, 24, 60, 120 mo	Various features
Cap Table Stakeholders	14 added	0	Cap Table
Customers	Not entered	150	Health Check

Root Cause Hypothesis: The platform appears to have multiple data stores or calculation engines that are not synchronized. User-entered data in the Data Input section does not reliably propagate to the AI agents, Board Deck generator, Health Check, or Strategic Briefing. Some features compute their own metrics from raw financial data, leading to conflicting values.

8. UX and Product Observations

Onboarding Experience

- Account creation and onboarding flow is smooth and well-designed.
- Stage selection (Pre-seed to Public) is clear.
- Financial data entry in Simple mode is intuitive with real-time summary calculations.
- Missing: guided onboarding for Cap Table setup, integration connections, or Copilot introduction.

AI Copilot UX

- "Truth Scan" enrichment badge builds trust — shows when AI cross-references web data.
- Multi-agent display (CFO Agent, Market Agent) is transparent and professional.
- Suggested follow-ups after each answer are contextually relevant.
- 'Data gaps' warnings are helpful but repetitive — same 3 suggestions appear on every answer.
- Missing: conversation threading. Each question is independent. No way to say 'elaborate on point 2'.

Investor Room

- Clean interface for managing fundraising rounds.
- IPO round creation worked correctly (\$280M, \$1.3B pre-money, Equity type).
- Missing: ability to attach documents, set investor access permissions, or create a data room.

Navigation and Layout

- Left sidebar navigation is clear with logical grouping.
- Dashboard overview provides quick health snapshot.
- Error handling is poor — crashes show raw error messages ('u.map is not a function') with no recovery option.
- No 'Report a Bug' or feedback mechanism visible in the UI.

9. Feature-by-Feature Scoring

Feature	Score	V1	Status	Notes
Onboarding	8/10	8/10	Stable	Well-designed flow
Data Input (Simple)	7/10	7/10	Stable	Works reliably, saves data
Data Input (Advanced)	0/10	0/10	Broken	Crashes on toggle
AI Copilot	7.5/10	8/10	Stable	Best feature, uses wrong data
Simulation Engine	0/10	4/10	Broken	100% crash rate
Cap Table	1/10	5/10	Worse	Data loss + new add bug
KPI Dashboards	2/10	1/10	Partial	Creates but cannot view
Board Decks	7/10	7/10	Stable	Good output, data issues
Health Check	7/10	7/10	Stable	Comprehensive metrics
Strategic Briefing	7/10	8/10	Stable	Best report feature
Investor Room	7/10	7/10	Stable	Clean, functional

10. Prioritized Recommendations

P0 — Ship This Week (Blocking Core Value)

#	Recommendation	Impact
1	Fix "X is not defined" in Simulation Engine. This is the #1 value proposition. Root cause: likely an undefined variable in the simulation runner JavaScript. Add null checks and proper error boundaries.	Unlocks the entire simulation, what-if, and stress test suite.
2	Fix "u.map is not a function" in Advanced Data Input. The array being mapped is likely undefined on initial load. Add default empty array fallback and type guards.	Allows entry of gross margin, churn, and 10+ advanced metrics. Fixes data quality for all AI features.
3	Fix Cap Table persistence and HTTP 400 on Add Stakeholder. Data storage layer is losing stakeholders between sessions. Add Stakeholder API likely has a validation issue (check request payload schema).	Cap table is essential for pre-IPO companies. Currently zero functionality.

P1 — Ship This Sprint (Data Quality)

- **4. Unify data propagation.** Ensure all features (Copilot, Health Check, Board Decks, Briefing) read from a single source of truth. Currently, each feature computes its own values, creating 3+ conflicting numbers for gross margin, burn rate, and runway.
- **5. Fix KPI Dashboard "v.map" crash on load.** Same class of bug as Advanced Data Input — array.map called on a non-array value.
- **6. Fix ARR calculation in Board Decks.** Shows \$60M instead of \$222M. Likely using MRR x 3.24 instead of MRR x 12.
- **7. Propagate headcount correctly.** Data Input shows 1,300; Health Check shows 250. Revenue-per-employee and other derived metrics are wrong.

P2 — Ship Next Sprint (Product Quality)

- **8. Tailor board deck narratives per type.** Monthly Update, Fundraising Prep, and Scenario Analysis should not share identical executive summaries.
- **9. Add error boundaries with recovery.** Raw JS errors should never reach users. Show a friendly error message with a 'Reload' button and a 'Report Bug' link.
- **10. Fix AI Copilot question misinterpretation.** Competitive positioning questions should not be routed to the simulation comparator. Add intent classification.
- **11. Improve simulation parameter calibration.** Monte Carlo returned 0% survival for a company with 17+ months runway. The base parameters (growth rate, burn) need better initialization from entered data.
- **12. Add conversation threading to AI Copilot.** Allow follow-up questions in context rather than treating each as independent.

P3 — Backlog (Enhancement)

- **13. Add guided onboarding for Cap Table.** Walk users through adding founders, investors, and initial equity allocation.
- **14. Pre-populate Use of Funds slide** in Fundraising Prep deck from IPO allocation data.
- **15. Reduce repetitive data gap warnings** in Copilot responses. Show once per session, not on every answer.
- **16. Add document upload and data room** to Investor Room.
- **17. Flag AI-estimated values clearly.** When the system estimates customer count or other metrics, show an 'Estimated' badge so founders know to verify.
- **18. Add export capabilities** for Board Decks (PPT/PDF), Health Check (PDF), and Strategic Briefing (PDF).

11. Conclusion

FounderConsole.ai has a genuinely compelling vision: a unified platform where founders can manage financial data, run strategic simulations, get AI-powered advice, maintain cap tables, and generate board decks. The AI layer — particularly the Copilot, Board Deck Generator, and Strategic Briefing — demonstrates real product-market potential. The multi-agent AI architecture (CFO Agent, Market Agent, Truth Scan) is architecturally sound and produces meaningfully better answers than a generic chatbot.

However, the platform is currently in a state where its core infrastructure features (simulation, data input, cap table, dashboards) are broken to the point of being non-functional. A founder evaluating this tool for real decision-making — such as modeling an IPO, planning a fundraising, or managing equity — would be blocked on the first session. The fact that announced bug fixes did not resolve these issues (and introduced new regressions) raises concerns about the development and QA process.

The most urgent action is fixing the three 'map is not a function' class errors and the simulation engine 'X is not defined' crash. These appear to share a common root cause: the frontend expects arrays from API responses but receives undefined or non-array values. Adding defensive type checking and default fallbacks across the codebase would likely resolve all four crash bugs simultaneously.

Overall Rating: 5.0 / 10

Strong AI capabilities held back by critical infrastructure bugs and data integrity issues

Potential Rating After P0 Fixes: 7.5 / 10

Fixing the 3 critical bugs and unifying data propagation would immediately unlock the full product experience.

Report compiled by Perplexity Computer on March 19, 2026. Testing performed using a real Shiprocket account with actual company financial data from the DRHP filing.
